

Tortoise Real Yield Index[®]

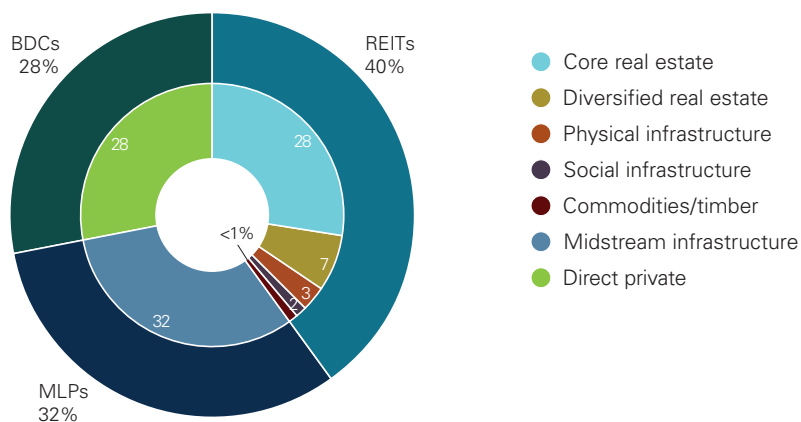

About the index

The Tortoise Real Yield Index[®] is a differentiated index that aims to track real asset exposure anchored in current income. It provides an efficient benchmark for real yielding, tax pass-through, liquid companies that distribute substantial cash flow streams to investors by investing in REITs (real estate investment trusts), MLPs (master limited partnerships) and BDCs (business development companies). The index provides a benchmark of companies with tangible essential assets that are supportive of economic activity with no commodity futures, precious metals, TIPS (treasury inflation-protected securities) or foreign currency exposure.

Why Real Yield[®]

- Comprehensive yield-focused real asset companies illustrates relevant investment opportunity, now and across business cycles
- What defined the last 25 years – declining interest rates and low inflation – is not necessarily what can be expected going forward
- Defines equity-like exposure to real assets with attractive yield and diversification potential
- Helpful benchmark for investors with recurring, multi-year funding obligations

Sector breakdown[†]

[†]REITs include core real estate, diversified real estate, physical (communication and storage) infrastructure, social (healthcare) infrastructure and timber constituents. MLPs include midstream infrastructure constituents. BDCs include direct private constituents.

Implied yield¹ as of 3/31/2019

Source: Tortoise and Bloomberg. ¹Implied yield is calculated as the sum of distributions over prior 12 months divided by spot price of index.

Disclaimers

The characteristics provided for the index are illustrative of the characteristics of an asset class and are not indicative of the performance of any investment product. The historical data of the index prior to its inception date was calculated on the same basis on which the index is currently calculated. Past characteristics are no guarantee of future results. It is not possible to invest directly in an index.

REITs = FTSE NAREIT All Equity REITs Index, a free-float adjusted, market capitalization-weighted index of U.S. equity REITs. Constituents of the index include all tax-qualified REITs with more than 50% of total assets in qualifying real estate assets other than mortgages secured by real property. Utilities = S&P Utilities Select Sector Index, a modified market-cap weighted index composed of constituents of the S&P 500 in the utility sector (as defined by the Global Industry Classification Standard). Treasuries = BofA Merrill Lynch 7-10 Year U.S. Treasury Index, a subset of the BofA Merrill Lynch U.S. Treasury Index that includes all securities with a remaining term to final maturity greater than or equal to seven years and less than 10 years. Sharpe ratio is the excess return per unit of risk in an index (total return minus risk free rate divided by standard deviation). Risk free rate is the interest an investor would expect from a risk-free investment and is based on the BofA Merrill Lynch 3-Month Treasury Bill Index, an unmanaged index that measures returns of three-month treasury bills. Standard deviation is a statistical measure of the historical volatility of the index, usually computed using monthly returns. Sortino ratio is calculated as the measure of excess return per unit of downside risk in an index. Downside risk reflects the standard deviations of monthly total returns below 0% divided by total number of months, on an annualized basis.
