

Tortoise Real Yield[®] Index

About the index

The Tortoise Real Yield[®] Index is a new differentiated index that aims to track real asset exposure anchored in current income. It provides an efficient benchmark for real yielding, tax pass-through, liquid companies that distribute substantial cash flow streams to investors by investing in REITs (real estate investment trusts), MLPs (master limited partnerships) and BDCs (business development companies). The index provides a benchmark of companies with tangible, essential assets that are supportive of economic activity with no commodity futures, precious metals, TIPs (Treasury Inflation-Protection Securities) or foreign currency exposure.

Why Real Yield[®]

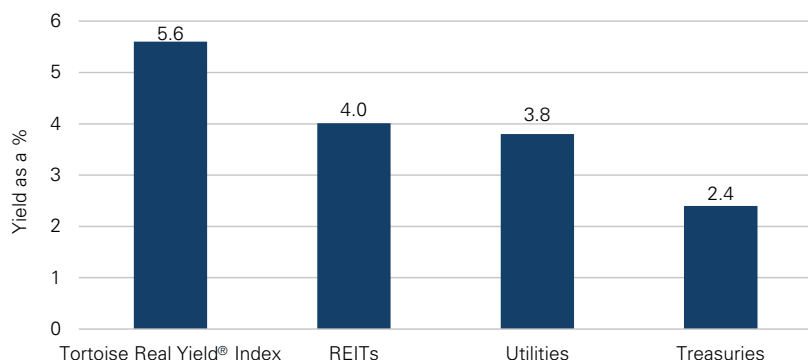

- Comprehensive yield-focused real asset companies illustrates relevant investment opportunity, now and across business cycles
- What defined the last 25 years – declining interest rates and low inflation – is not necessarily what can be expected going forward
- Defines equity-like exposure to real assets with attractive yield and diversification potential
- Helpful benchmark for investors with recurring, multi-year funding obligations

Sector breakdown*†

*REITs include diversified real estate, core real estate, social (healthcare) and physical (communication & storage) infrastructure and timber. MLPs include midstream infrastructure and commodity (oil & gas production) constituents. BDCs include direct private constituents.

Implied yield¹ (as of 12/31/2016)

Source: Tortoise, Bloomberg. ¹Implied yield is calculated as the sum of distributions over prior 12 months divided by spot price of index.

Tortoise Real Yield® Index

5 year historical index performance (as of 12/31/2016)

● Tortoise Real Yield® Index ● REITs ● Utilities ● Treasuries

Disclaimers

The characteristics provided for the index are illustrative of the characteristics of an asset class and are not indicative of the performance of any investment product. The historical data of the index prior to its inception date was calculated on the same basis on which the index is currently calculated. Past characteristics are no guarantee of future results. It is not possible to invest directly in an index.

REITs = FTSE NAREIT All Equity REITs Total Return Index, a free-float adjusted, market capitalization-weighted index of U.S. Equity REITs. Constituents of the index include all tax-qualified REITs with more than 50% of total assets in qualifying real estate assets other than mortgages secured by real property. Utilities = The S&P Utilities Select Sector Index, a modified market-cap weighted index composed of constituents of the S&P 500 in the utility sector (as defined by the Global Industry Classification Standard). Treasuries = Bloomberg Barclays U.S. Treasury 7-10 Year Total Return Index Value Unhedged USD, an unmanaged index that tracks the performance of the direct Sovereign debt of the U.S. Government with at least \$250 million in outstanding face value and a remaining term to final maturity of at least seven years and less than ten years. Sharpe ratio is the excess return per unit of risk in an index (total return minus risk free rate divided by standard deviation). Risk free rate is the interest an investor would expect from a risk-free investment and is based on the Bloomberg Barclays U.S. Treasury 7-10 Year Total Return Index Value Unhedged USD. Standard deviation is a statistical measure of the historical volatility of the index, usually computed using monthly returns. Sortino ratio is calculated as the measure of excess return per unit of downside risk in an index. Downside risk reflects the standard deviations of monthly total returns below 0% divided by total number of months, on an annualized basis.
